The "CCTV - from light to pixels" seminar in Singapore - Day 2, is now behind me.

Over 100 people attended the first-rate Lifelong Learning Institute in Singapore. They were a delightful audience to talk to about light, optics, cameras, sensors, HD, 4k, compressions, networking, VMSs, storage, CCTV system design and testing.

The venue was first-class. The amphi-theatre had great wireless sound, an excellent large HD projector, and tiered seating so all could see. The refreshments and meals were plentiful and very good quality. Conference & Exhibition Management Services (CEMS) are fantastic organisers and Security Systems Association of Singapore (SSAS), who invited me, are to be highly commended also.

As a lecturer having done many seminars around the world, I have to rank this experience as one of the best.

Even more impressive for me was the realisation that the Singaporean government has started a new initiative whereby the attendants receive a study payment of \$500 for further education. This certainly helped SSAS attract the attendants for this seminar.

There were also attendants from Hong Kong, Myanmar and Brunei. This was encouraging to see for the development of their own technical industries.

For two full days, with over 300 slides, we covered almost the full content of my latest book "CCTV - from light to pixels" (which is just on 600 pages!) Many interesting questions and

discussions regarding the new standards, video analytics development, and practical demonstration of the ViDiLabs calc application occurred.

This training seminar is the way forward to further improve the security know-how and efficiency of our industry for the safety of the public. The SSAS has set the standard, in my opinion.

Thank you Singapore, hope to come back soon again!
